Synonyms: apologize for, cloak, conceal, cover, extenuate, hide, mitigate, screen, veil. *Cloak*, from the French, and *palliate*, from the Latin, are the same in original signification, but have diverged in meaning; a cloak may be used to *hide* completely the person or some object carried about the person, or it may but partly *veil* the figure, making the outlines less distinct; *cloak* is used in the former, *palliate* in the latter sense; to *cloak* a sin is to attempt to *hide* it from discovery; to *palliate* it is to attempt to *hide* some part of its blameworthiness. "When we *palliate* our own or others' faults we do not seek to *cloke* them altogether, but only to *extenuate* the guilt of them in part." TRENCH *Study of Words* lect. vi, p. 266. Either to *palliate* or to *extenuate* is to admit the fault; but to *extenuate* is rather to *apologize for* the offender, while to *palliate* is to disguise the fault; hence we speak of *extenuating* but not of *palliating* circumstances, since circumstances cannot change the inherent wrong of an act, though they may lessen the blameworthiness of him who does it; *palliating* a bad thing by giving it a mild name does not make it less evil. In reference to diseases, to *palliate* is really to diminish their violence, or partly to relieve the sufferer. See ALLEVIATE.—Antonyms: see synonyms for AGGRAVATE.

Compare COSMOLOGY. It has three generic forms, with variations: **one-substance pantheism,** which ascribes to the universal being the attributes of both mind and matter, thought and extension, as in Spinoza's system; **materialistic p.,** which ascribes to it only the attributes of matter, as in the system of Strauss; **idealistic p.,** which ascribes to it only the attributes of mind, as in Hegel's system. The last two, in certain varieties, may be regarded as sinking all in nature and man respectively, a variety that sinks all in God might be termed *hyperthеism.*

Pantheism . . . is absolute monism, maintaining that the entire phenomenal universe is the ever-changing existence-form of the one single universal substance, which is God. Thus God is all, and all is God. A. A. HODGE *Outlines of Theology* ch. 2, p. 50. [C. & B. BROS.]

2. (a) Primitive: the worship of nature in personified objects and powers of nature. (b) Modern poetic or esthetic: the worship of nature for itself or its beauty. (d) Realistic: the deification of natural causes, conceived as one personified nature, to which the religious sentiment is directed.

Pantheism, when explained to mean the absorption of God in nature, is atheism, and the doctrine of Spinoza has been so regarded by many. When expounded to mean the absorption of nature in God — of the finite in the infinite — it amounts to an exaggeration of theism. K.-E. *Vocab. Philos.* p. 350. [SH. & CO.]

A Paper-making Machine.

The pulp is mixed in the agitating-box (*a*), pumped into the regulating-box (*rb*), and allowed to flow out of a gate or fountain, at the breast-roll (*b*) to an endless wire cloth or apron (*e*), carried by bands or deckles (*d*) under the dandy-rolls (*dr*), which determine the water-mark and whether the paper is to be wove or laid. While on the wire apron (*e*) the pulp is shaken to cross the fibers. A save-all box (*s*) catches and preserves the drain-water, with accompanying size, coloring-material, etc. The couch-rolls (*c*) take the imperfectly formed paper-pulp to an endless wet felt apron, by which it is carried between the rolls (*w*), thence on the press-felt apron to the press-rolls (*p*). These rolls squeeze out most of the water, and the pulp, which may now be called paper, is ready for drying and calendering. The series of hot-drying cylinders (*h*) is kept at a proper temperature by steam, and takes all the dampness out of the paper, which next passes to the calender-rolls (*cr*), receiving a finish by pressure. It is then wound on the reels (*r*) or slit into narrower widths and wound, according to convenience.

To *pardon* is the act of a superior, implying the right to punish; to *forgive* is the privilege of the humblest person who has been wronged or offended. To *condone* is to put aside a recognized offense by some act which restores the offender to forfeited right or privilege, and is the act of a private individual with no legal formalities. To *excuse* is to *overlook* some slight offense, error, or breach of etiquette; *pardon* is often used by courtesy in nearly the same sense. A person may speak of *excusing* or *forgiving* himself, but not of *pardoning* himself. See ABSOLVE. 2. [P.] The supreme legislature of the United Kingdom of Great Britain and Ireland, composed of the three estates of the realm — the lords spiritual, the lords temporal, and the commons — together with, in a strict legal sense, the sovereign.

The archetype of Parliament is found in the ancient Teutonic system of popular representation in government, perhaps transmitted through the *witenagemote* ("assembly of sages") of the Anglo-Saxons. After the Norman conquest (1066) the national assembly was transformed into a selected royal council, dominated by the king; but from time to time its prerogatives were regained, and it was recognized in Magna Charta (1215) as the supreme legislative body of the kingdom. The name *Parliament* was applied to it in the reign of Henry III. (1266). The separation of the two houses into Lords and Commons dates from the middle of the 14th century, the reign of Edward III. A Pendulum and Connected Mechanism in a Clock.

In mechanics, for simplifying mathematical treatment, a *simple pendulum* is conceived of as a material particle suspended by a weightless cord and vibrating without friction. An actual material pendulum is called a *compound pendulum*, and may be regarded as made up of an infinite number of simple pendulums, each striving to oscillate in its own proper period, the resulting period being a compromise or average. The chief uses of the pendulum are (1) to measure or mark time, as in a clock, chronograph, or metronome, owing to the fact that in the same place the time of a swing remains practically the same no matter whether it swings through a large or a small arc, and (2) to measure the intensity of gravity at different places, owing to the dependence of the time of swing on the impelling force.
[Neut. of L. *pendulus;* see PENDULOUS.]

2. *Psychol.* The faculty or power of acquiring immediate and fundamental knowledges; acquisitive cognitive faculty. See COGNITIVE. In the wide sense perception may be regarded as including (1) *internal perception*, or self-consciousness, (2) *external perception*, or sense-perception, and (3) *intuition*, the perception of first truths; in the narrow sense it is confined to sense-perception. The conditions of knowledge by external perception are (1) the presence and action of a perceiving mind, (2) the existence in normal condition of the sense-organism, and (3) the existence and presence of appropriate objects brought into proper connection with the sense-organism.

But *perception*, in the technical and limited sense of the term, is appropriated to the knowledge of material objects and of the external world. This knowledge is gained or acquired by means of the senses, and hence, to be more exact, we call it sensible *perception*, or, more briefly, sense-*perception*.

—Perpendicular architecture, the type assumed by Pointed architecture in England from toward the end of the 14th century, though the tendency toward this type can be traced further back. It is characterized mainly by a mechanical accentuation of the vertical lines; by tracery in the general form of rectangular gratings with rather small openings, often filling large windows; by markedly flat keel-shaped arches, very commonly framed in square panels; and by prismatic turrets with domical summits ornamented, like the pinnacles of the style, with crockets and finials of cabbage form or other barbarous character. The style is noted for the elaborate fan tracery of much of its vaulting, and has produced some very noble interiors, as those of Henry VII.'s Chapel in Westminster Abbey and of King's College Chapel, Cambridge. It was developed from the late or flowing Geometrical style, and passed into the Tudor and the Jacobean. See ENGLISH ARCHITECTURE, under ENGLISH, and POINTED ARCHITECTURE, under POINTED.

per-spec'tive, per-spec'tiv, *n.* **1.** The art or theory of representing by a drawing made on a flat surface solid objects or surfaces conceived of as not lying in that surface; delineation of objects as they appear to the eye; specifically, in mathematics, a branch of projective geometry.

In perspective the eye is supposed to occupy a definite point called the **station-point,** or **point of sight,** and the picture is supposed to be at right angles to the line of vision in a plane called the **plane of delineation,** the **perspective plane,** or the **picture-plane.** If straight lines be drawn to the eye from every point to be represented, the point where each line cuts the picture-plane is the corresponding point in the picture. To repre-

sent thus in the proper place an **original line** or **plane** (that is, one in nature) it is necessary first to find its **vanishing-point** or **-line,** the intersection with the picture-plane of a line or plane passing through the eye parallel with the original line or plane, and the **intersecting-point** or **-line,** the intersection of the original line or plane with the picture-plane. As aids in the work, the draftsman must consider the **ground-line,** the intersection of the picture-plane with the ground; the **directing-plane,** passing through the eye parallel to the picture-plane; the **directing-line,** the intersection of this with an original plane; the **directing-point,** its intersection with an original line; the **director,** a line from the eye to a directing-point; the **line of direction** or **direct radial,** the perpendicular from the eye on the picture-plane; the **center of vision,** the foot of this perpendicular; the **principal distance,** the length of this line; the **horizontal plane** through the eye; the **horizontal line** or **horizon,** the intersection of this with the picture-plane; and the **points of distance,** points on the horizon at the same distance from the center of vision as the eye is. In drawing a perspective view from a ground-plan (see illus.) the point in the picture corresponding to

The Principles of Perspective, showing method of drawing a perspective view from a ground-plan.

1. Angular perspective view of a right hexagonal prism of 30 inches to a side and 30 inches high; 18 inches from the ground-line and 18 inches to the left of *LD*. 2. Parallel perspective of a rectangular slab, 5 feet to the right of *LD* and one side touching the ground-line.

GL, ground-line; *PD, PD*, points of distance, and vanishing-points for all lines making angles of 45° with the ground-line, and measuring-points for all lines making right angles with the ground-line; *VP, VP*, vanishing-points, *CV*, center of vision and vanishing-point for all lines making right angles with the ground-line; *HL*, horizon; *LD*, line of direction (from spectator's eye to *CV*); *SP*, station-point (of observer).

any point in the plan is found by dropping a perpendicular from the latter to the ground-line, and measuring on the ground-line a distance from the foot equal in length to the perpendicular. This point is joined to the point of distance and the foot of the perpendicular is joined to the center of vision. The intersection of these two lines is the point sought.

2. *Paint.* The art of conveying the impression of depth and distance; representation of scenes as they appear to the eye, by means of correct drawing, shadows, tones of color, etc.

Aerial *perspective* is the expression of space. RUSKIN *Modern Painters* vol. i, pt. ii, § 2, ch. 1, p. 139. [W. & S. '58.]

3. The effect of distance upon the appearance of objects, by means of which the eye measures their distance. **4.** The relative importance of facts or matters from any special point of view; also, their presentation or description with just regard to their proportional importance.

In the dim twilight of mental science, which has shown all things distorted and nothing in its true proportions, it is no wonder that the beautiful order and *perspective* of the moral world should have been concealed from our eyes.
A. T. BLEDSOE *Theodicy* pt. i, ch. 5, p. 167. [CA. & P. '54.]

5. A distant view; vista; prospect: also figuratively.

We are commonly taught, that *perspicuity* depends upon a proper choice of words, a proper structure of sentences, and a proper order in the whole composition; . . . but it supposes distinctness in our conceptions. THOMAS REID *Works, Intellectual Powers* in vol. ii, essay iv, p. 399. [S. E. '14.]

[< F. *persuader,* < L. *persuadeo,* < *per,* through, + *suadeo,* advise.] **per-swade'†.**
Synonyms: allure, bring over, coax, convince, dispose, entice, impel, incite, incline, induce, influence, lead, move, prevail on or upon, urge, win over. Of these words *convince* alone has no direct reference to moving the will, denoting an effect upon the understanding only; one may be *convinced* of his duty without doing it, or he may be *convinced* of truth that has no manifest connection with duty or action, as of a mathematical proposition. To *persuade* is to bring the will of another to a desired decision by some influence exerted upon it short of compulsion; one may be *convinced* that the earth is round; he may be *persuaded* to travel round it; but persuasion is so largely dependent upon conviction that it is commonly held to be the orator's work first to *convince* in order that he may *persuade. Coax* is a slighter word than *persuade,* seeking the same end by shallower methods, largely by appeal to personal feeling, with or without success; as, a child *coaxes* a parent to buy him a toy. One may be *brought over, induced,* or *prevailed upon* by means not properly included in persuasion, as by bribery or intimidation; he is *won over* chiefly by personal influence. It embraces (1) *persuasion proper,* in which motives are presented to lead the hearer to the direct formation of a positive purpose, and (2) *dissuasion,* in which the object is to change some dominant purpose.

In *Persuasion,* the object of discourse is to move the will, either by leading it to a new act or purpose, or by dissuading it from one already adopted. DAY *Art of Discourse* § 209, p. 190. [S. '67.]

Crude petroleum is a dark-brown to greenish liquid, which by refining yields cymogene, rhigolene, gasoline, naphtha, benzin, kerosene, lubricating-oil, and paraffin. It is found in various parts of the world, as in the United States, southern Russia, and India. The first-named country, since the development of the industry (dating from 1859), chiefly controls the markets of the world. The output from Russia, though less refined, is also very considerable. But the Russian chemist Mendeleeff holds that petroleum was formed in the depths of the earth by chemical action of water on heated metallic carbids. The perpetual fires at pagan shrines are believed to have been springs of petroleum ignited at the surface. Pliny describes its use in lamps. Genoa was lighted by petroleum from the wells of Amiano, and the American Indians collected petroleum, which they sold under the name of *Seneca oil* for various purposes, especially as a remedy for rheumatism.

Phonography owes its principal development to Isaac Pitman, of Bath, England, who has issued more than a hundred books relating to it. Many of the existing stenographic systems are at least based upon its ideas. In all the systems of the Pitmanic school the consonants are represented by straight or curved lines and the vowels by dots and dashes. In practical use the vowels are mostly discarded, the arbitrary position of a stem or combination of stems (above, on, or below the line) indicating a word or noting the most important omitted vowel. In the United States about 50 per cent. of the official stenographers write Pitman as modified by Andrew J. Graham. Other phonographic systems in use in the United States, named after their originators or modifiers, are those of Benn Pitman (brother of Isaac Pitman), Munson, Lindsley, Bishop, Osgoodby, Cross, Burns, etc.

pho-tog′ra-phy, fo-teg′ra-fi, *n.* The process of forming and fixing an image of an object or objects by the chemical action of light, usually on a film containing salts sensitive to light, and spread on a plate of metal or glass or on paper or celluloid; also, the art or business of producing such images and of reproducing them by helical printing: a development of the discovery announced by Daguerre in 1839 (see DAGUERREOTYPE), and first applied to portraits by Draper.

The sensitive salts usually employed are silver nitrate and the haloid salts of silver and of potassium. An image being thrown on the sensitized surface in a camera, a chemical change takes place in the salts, which is greater in the more highly illuminated portions. If this change turns or leaves the surface light or white it produces a *positive*, if dark a *negative*, the lights and shades being reversed in the latter case. In ordinary photography a negative is first produced on a transparent plate or film, but it is invisible until *developed*, or washed in a liquid, as pyrogallic acid combined with an alkali, that forms an opaque compound with the part of the salt affected by the light. The developed

image is *fixed*, or made permanent, by washing in a liquid that removes the salt from parts unaffected by light, and a positive is then printed from it by placing it in contact with sensitized paper or other material, and exposing both to the light. Photography on wood is an important adjunct of modern wood-engraving. The pores of the boxwood are filled up with a strong solution of gelatin, a thin white surface laid on, and printed upon in a special frame from a photographic negative. This takes the place of a drawing on wood, and the engraver cuts away the light parts and proceeds as in ordinary wood-engraving. For photographic processes, see CALOTYPE, CARBON-PRINTING, COLLODION PROCESS, and DAGUERREOTYPE. For the different photomechanical reproduction processes, see GELATIN PROCESS, HELIOTYPY, PHOTOENGRAVING, and PHOTOMECHANICAL. In the sciences photography is employed to study rapid movements by taking a series of instantaneous views at equidistant very small intervals, and in astronomy (1) to detect stars, etc., otherwise invisible through the telescope, (2) to note the receding or approaching movement of heavenly bodies along the line of sight, and (3) to prepare celestial charts, etc.

that the faculties of the mind are manifested through special organs, or in separate portions of the brain, equal in number to the mental faculties, and that temperament modifies the strength and activity of mind and body; the doctrine that the mental characteristics and powers are indicated by developments of the brain upward, forward, and backward from the medulla oblongata, which are measured by cranial diameters and distances from the opening of the ear. The popular idea as to supposed significance of cranial protuberances or "bumps" is an error, because the hollows on the inside of a skull do not correspond to the elevations on the outside.

The system was formulated by Dr. Franz Joseph Gall (1758–1826), of Vienna, and later was expounded and developed by J. G. Spurzheim, George and Andrew Combe, and others.

They multiply parthenogenetically, and after a few generations give rise to winged females that feed on the leaves and buds and lay eggs of two sizes, from the larger of which wingless females develop, and from the smaller wingless males. The female after fertilization lays a single egg, the winter egg, from which a wingless female, the stock-mother, is hatched in the spring. The stock-mother creeps into the buds, forming galls on the under side of the leaf, and multiplies parthenogenetically, some of the offspring forming new galls, others descending to the roots.

Physics is generally held to treat of (1) the *constitution and properties of matter*, (2) *mechanics*, (3) *acoustics*, (4) *heat*, (5) *optics*, and (6) *electricity* and *magnetism*. As sometimes used in a limited sense, it embraces only the last four divisions; more generally and loosely, it includes all the physical sciences. See PHYSICAL SCIENCES, under PHYSICAL.

Evidently . . . *physics* regards matter solely as the vehicle of energy. And hence from this point of view, *physics* may be defined as that department of science whose province it is to investigate all those phenomena of nature which depend, either upon the transference of energy from one portion of matter to another, or upon its transformation into any of the forms which it is capable of assuming. In a word, *physics* may be regarded as the science of energy, precisely as chemistry may be regarded as the science of matter. G. F. BARKER *Physics* ¶ 8, p. 6. [H. H. & CO. '92.]

They held that society should be governed by a natural order inherent in itself; that land and its unmanufactured products are the only true wealth, the precious metals being a false standard; that the proper source of state revenue is direct taxation of land; and they maintained the right of freedom of trade, person, opinion, and property. pine[1], *n.* **1.** Any tree of the genus *Pinus,* of the pine family (*Coniferæ*).

Pine-leaves and a Pine-cone.

1. Two-leaved fascicle of the yellow pine (*Pinus mitis*). Compare illus. under ACEROSE. 2. Three-leaved fascicle of Sabine's pine (*P. Sabiniana*). 3. Five-leaved fascicle of the sugar-pine (*P. Lambertiana*). 3*a*, a scale and its two seeds from the cone (3*b*) of the sugar-pine.

The true pines are readily distinguished from the spruces, firs, larches, cedars, etc., of the same family, and formerly included in the same genus, by their leaves and their cones. The leaves, which are evergreen, needle-shaped, and from a little more than an inch to more than a foot in length, are in small clusters, of 1 to 5 according to the species, sheathed at the base by thin chaff-like scales, and have their inner and outer faces such that when pressed together they make a solid cylinder. Their cones are peculiar in the thickening of their persistent woody scales into a more or less pyramidal elevation at the top, with a boss in the center which is often prominent and hooked. The pines are confined to the northern hemisphere and (excepting a species in the Canaries) to America, Europe, and Asia. They are found mainly in cold and temperate regions, very rarely in the torrid zone, usually growing together in masses and forming extensive forests. In size they range from a few feet in height to 300 feet. For economic purposes they are of great value, some yielding large supplies of timber for carpentry and building; some highly resinous species, turpentine; and others, as the nut-pines, edible seeds. About 70 species are known, of which 26 are found in the United States. Among the most common are: (1) In the United States, the white pine (*P. Strobus*), the long-leaved, Southern yellow, or Georgia pine (*P. palustris*), the loblolly-pine or old-field pine (*P. Tæda*), the red pine (*P. resinosa*) of the eastern portion, Sabine's pine (*P. Sabiniana*), Lambert's pine or sugar-pine (*P. Lambertiana*), and a nut-pine (*P. edulis*) of the Pacific States. (2) In the Old World, the Scotch pine or fir (*P. sylvestris*) of middle and northern Europe and Asia, and the cluster-pine (*P. Pinaster*) and the stone-pine (*P. Pinea*) of southern Europe. For these and others, see below or in vocabulary place.

The pitch of an instrument is expressed by the vibrations per second of some one of its notes, generally middle C, treble C, or the A between them. The number of vibrations of middle C in various pitches is here given:

Old theoretical pitch	256
French pitch (*Franz-ton*)	261
Helmholtz's theoretical pitch	264
Average modern concert pitch	270

The French pitch is used by the leading American orchestras, and has been recommended by the associated piano-manufacturers of the United States as the standard pitch. The tendency is for the pitch to rise, owing to the desire of singers and orchestral leaders to avoid flatting. In 130 years concert pitch in England rose from 283 to 273. Pitch is preserved by means of standard tuning-forks; but these often vary appreciably. Pitch is either *absolute* or *relative;* the former when it is thought of without reference to relationship, the latter when reference is made to a tone's relation to other tones or its place in a key-system. The absolute pitch of tones is indicated by the names A, B, C, etc., which remain always the same for the same tone; the relative pitch is described by such names as *key-tone, tonic, one, do*, etc., which change with every change of key. See KEY.

WHITTIER *At School-Close* st. 12.

Synonyms: abject, base, contemptible, despicable, lamentable, miserable, mournful, moving, paltry, pathetic, piteous, pitiable, sorrowful, touching, woful, wretched. *Pitiful* originally signified full of pity; as, "the Lord is very *pitiful* and of tender mercy," *James* v, 11, but this usage is now archaic, and the meaning in question is appropriated by such words as merciful and compassionate. *Pitiful* and *pitiable* now refer to what may be deserving of pity, *pitiful* being used chiefly for that which is merely an object of thought, *pitiable* for that which is brought directly before the senses; as, a *pitiful* story; a *pitiable* object; a *pitiable* condition. Since pity, however, always implies weakness or inferiority in that which is pitied, *pitiful* and *pitiable* are often used, by an easy transition, for what might awaken pity, but does awaken contempt; as, a *pitiful* excuse; he presented a *pitiable* appearance. *Piteous* is now rarely used in its earlier sense of feeling pity, but in its derived sense applies to what really excites the emotion; as, a *piteous* cry. Synonyms: commiseration, compassion, condolence, mercy, sympathy, tenderness. *Sympathy* (feeling or suffering with) implies some degree of equality, kindred, or union; *pity* is for what is weak or unfortunate, and so far, at least, inferior to ourselves; hence, *pity* is often resented where

sympathy would be welcomed. We have *sympathy* with one in joy or grief, in pleasure or pain, *pity* only for those in suffering or need; we may have *sympathy* with the struggles of a giant or the triumphs of a conqueror; we are moved with *pity* for the captive or the slave. *Pity* may be only in the mind, but *mercy* does something for those who are its objects. *Compassion*, like *pity*, is exercised only with respect to the suffering or unfortunate, but combines with the tenderness of *pity* the dignity of *sympathy* and the active quality of *mercy*. *Commiseration* is as tender as *compassion*, but more remote and hopeless; we have *commiseration* for sufferers whom we can not reach or can not relieve. *Condolence* is the expression of *sympathy*. —**Antonyms**: barbarity, brutality, cruelty, ferocity, hard-heartedness, harshness, inhumanity, mercilessness, pitilessness, rigor, ruthlessness, severity, sternness, truculence. —**Prepositions**: pity *on* or *upon* that which we help or spare; pity *for* that which we merely contemplate; "have pity *upon* me, O ye my friends," *Job* xix, 21; "pity *for* a horse o'erdriven." plane′-tree″, plēn′-trē″, *n.* **1.** Any one of the several trees constituting the genus *Platanus*, especially the Oriental or common plane-tree (*P. orientalis*) of the Old World, with its variety the maple-leaved plane-tree (*P. acerifolia*), and the American plane-tree (*P. occidentalis*), usually called *sycamore* or *buttonwood* or *buttonball*.

The plane-trees are all large trees with close, smooth, white or whitish bark falling off in thin, brittle plates, large palmately lobed leaves, and the fruit a large ball or balls hanging on a long peduncle. The American species has its leaves larger than those of the Old World species, angularly sinuate-lobed with sharp-pointed short lobes, and the fruit-balls solitary on the peduncles; the Oriental species has the leaves smaller and more deeply cut and its fruit-balls frequently two or more.

The European *plane-tree* is like a tent. The foliage is all on the outside. The bird voices in it reverberate as in a chamber. BURROUGHS *Fresh Fields, Nature in Eng.* p. 32. [H. M. & CO. '85.]
